

$WW(x)$

U **writes** $x = 80$
 $P(v) \equiv (v < 50)$ is false

$PredWR(x)$: explains absence

T **reads** P
result omits x

S **writes** $x = 40$
now $P(40)$ is true

$PredRW(x)$: Δ

A later visible writer would contradict the explanation:
 x changes from *excluded* to *returned*.
